

TRY	CATCH	THROW	RETHROW	ERROR OBJECT
Code inside the try block is executed. If an error occurs, it moves to the catch block.	In the catch block, you can find the error details and do the needful	Manually creates an error called throw or custom errors.	Throwing the same error again inside to the main block “Catch” if it can’t be handled in child block.	In JavaScript, when an error occurs, it is represented as an error object, which contains information about the error, such as name, message, and stack.
